FYS4150: Project 4

Ingrid A V Holm

November 4, 2016

1 Introduction

The aim of this project is to study the Ising model in two dimensions.

2 The Ising model (ch. 13)

The Ising model describes pahse transitions in two dimensions. At a given critical temperature the model exhibits a phase transition from one magnetic moment (spin) to a phase with zero magnetization. Without an externally applied field, this is described as

$$E = -J \sum_{<kl>}^{N} s_k s_l \tag{1}$$

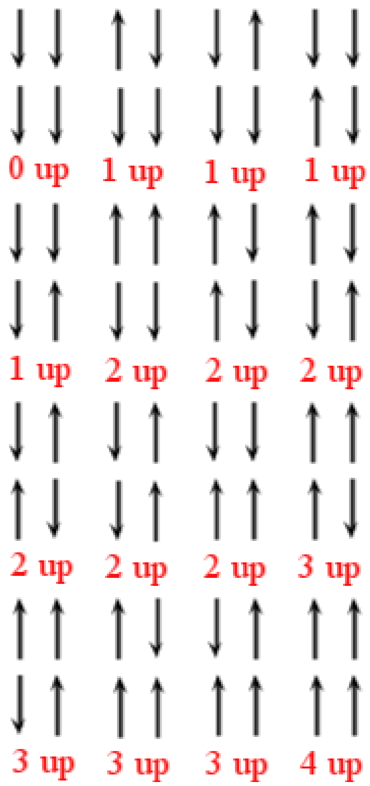
where $s_k = \pm 1$, N is the total number of spins and J is a coupling constant.

3 The Metropolis algorithm (ch. 12)

4 2x2 lattice

We consider a 2×2-lattice, meaning $L = 2$. The spins have 16 conifgurations. The probability distribution is given by

$$P_i(\beta) = \frac{e^{-\beta E_i}}{Z} \tag{2}$$



(a) Different spin configurations

№of spins pointing up	Degeneracy	E	M
0	1	-8J	-4
1	4	0	-2
2	4	0	0
2	2	8J	0
3	4	0	2
4	1	-8J	4

(b) Possible energies for a 2×2-lattice of spin particles.

Figure 1: Spins for a 2×2-lattice with periodic boundary conditions.

where $\beta = \frac{1}{kT}$ is the inverse temperature, k is te Boltzmann constant, E_i is the energy of a state i. The partition function is

$$Z = \sum_{i=1}^{M} e^{-\beta E_i} \tag{3}$$

This fuction is difficult to compute since we need all states. The Metropolis algorithm only considers *ratios* between probabilities, so we don't need to calculate this (luckily!)

$$\text{Metropolis } \rightarrow \frac{P_s}{P_t} = \frac{e^{-(\beta E_s)}}{e^{-(\beta E_k)}} = e^{-\beta(E_s - E_k)} = e^{-\beta \Delta E}$$

The partition function in our case is

$$
\begin{aligned}
Z(\beta) &= \sum_{i=1}^{M} e^{-(\beta E_i)} \\
&= 2e^{8J\beta} + 2e^{-8J\beta} + 12 \\
&= 4(3 + \cosh(8J\beta))
\end{aligned}
$$

The energy expectation value

$$
\begin{aligned}
\langle E \rangle &= -\frac{\partial \ln Z}{\partial \beta} = -\frac{\partial \ln Z}{\partial Z}\frac{\partial Z}{\partial \beta} = -\frac{1}{Z}\frac{\partial Z}{\partial \beta} \\
&= -\frac{4 \cdot 8J \sinh(8J\beta)}{4(3 + \cosh(8J\beta))} \\
&= -8J\frac{\sinh(8J\beta)}{3 + \cosh(8J\beta)}
\end{aligned}
$$

with the corresponding variance

$$
\begin{aligned}
\sigma^2 &= \langle E^2 \rangle - \langle E \rangle^2 = \frac{1}{Z}\sum_{i=1}^{M} E_i^2 e^{-\beta E_i} - \Big(\frac{1}{Z}\sum_{i=1}^{M} E_i e^{-\beta E_i}\Big)^2 \\
&= \frac{8^2 J^2 2e^{8J\beta} + 8^2 J^2 2e^{-8J\beta} + 0 \cdot 12}{4(3 + \cosh(8J\beta))} - \Big(-8J\frac{\sinh(8J\beta)}{3 + \cosh(8J\beta)}\Big)^2 \\
&= 32J^2\frac{2\cosh(8J\beta)}{(3 + \cosh(8J\beta))} - 64J^2\frac{\sinh^2(8J\beta)}{(3 + \cosh(8J\beta))^2} \\
&= J^2 64\frac{\cosh(8J\beta)(3 + \cosh(8J\beta)) - \sinh^2(8J\beta)}{(3 + \cosh(8J\beta))^2} \\
&= J^2 64\frac{3\cosh(8J\beta) + \cosh^2(8J\beta) - \sinh^2(8J\beta)}{(3 + \cosh(8J\beta))^2} \\
&= J^2 64\frac{3\cosh(8J\beta) + 1}{(3 + \cosh(8J\beta))^2}
\end{aligned}
$$

The specific heat capacity

$$
C_V = \frac{1}{k_B T^2}(\langle E^2 \rangle - \langle E \rangle^2) \tag{4}
$$

$$C_V = \frac{64J^2}{k_BT^2}\frac{3\cosh(8J\beta)+1}{(3+\cosh(8J\beta))^2}$$

The mean absolute value of the magnetic moment (mean magnetization)

$$\begin{aligned}\langle|\mathcal{M}|\rangle &= \frac{1}{Z}\sum_i^M |\mathcal{M}_i|e^{-\beta E_i}\\ &= \frac{1}{4(3+\cosh(8J\beta))}(4e^{8J\beta}+4\cdot 2e^0+2\cdot 4e^0+4e^{8J\beta})\\ &= 2\frac{e^{8J\beta}+2}{3+\cosh(8J\beta)}\end{aligned}$$

The susceptibility

$$\chi = \frac{1}{k_BT}(\langle\mathcal{M}^2\rangle - \langle\mathcal{M}\rangle^2) \tag{5}$$

$$\begin{aligned}\chi &= \frac{1}{k_BT}(\frac{1}{Z}\sum_i^M \mathcal{M}_i^2 e^{-\beta E_i} - \Big(\frac{1}{Z}\sum_i^M \mathcal{M}_i e^{-\beta E_i}\Big)^2)\\ &= \frac{1}{k_BT}\frac{(16e^{8J\beta}+4\cdot 4e^0+4\cdot 4e^0+16e^{8J\beta})}{4(3+\cosh(8J\beta))}\\ &= \frac{1}{k_BT}\frac{8e^{8J\beta}+8}{(3+\cosh(8J\beta))}\end{aligned}$$

The analytical values (calculated in Python) are found in table (**??**).

Z	$\langle E\rangle$	$\langle\lvert\mathcal{M}\rvert\rangle$	C_V	χ
5973.917	-7.9839	3.9946	0.1283	15.9732

Figure 2: Analytical values of the expectation values. Here $J = 1$, $k = 1$, $T = 1.0$ K.

For $mcs = 1000000$ cycles the results are very similar to the analytic results.
